

Fuel System on  
SAY GOODBYE  
1982 41 Defever Trawler

OPERATION:

For **normal** running of the engine, shut off the **valve #1, valve #2 and valve #5**. Open engine return **valve #3** (on engine). Fuel will be sucked from the tanks thru the filters, lift pump and into the engine.

To prime the system or use the Walbro as a lift pump...open the valve #1 before the Walbro and valve #2. Close valve #5. The Walbro will feed the engine.

**To polish fuel**...open valve #1 (before the Walbro) and valve #5. Close valve #2, valve #3 and valve #4. The Walbro will pull fuel thru the filters and around the engine into the return line and the tanks. (valve #3 closed prevents backing up into the engine return).

Notes:

1. All filters are Racor 500
2. The 2 micron filter pair uses ONE filter at a time. Second filter can be switched on line with valves
